PART 1 APPLICATIONS — What drives the requirements for displays?

1 How applications have driven display requirements	3
<i>Carl Machover</i>	
1.1 Introduction	3
1.2 Applications of displays	4
1.3 Resolution and addressability	8
1.4 Brightness and colour	11
1.5 Flicker and image motion	12
1.6 Field of view and display size	12
1.7 Other factors	14
1.8 Conclusion	14
Bibliography	15
2 Display requirements for desktop electronic imaging	17
<i>Lindsay MacDonald</i>	
2.1 Introduction	17
2.2 Quality in product design	18
2.2.1 Quality Function Deployment	18
2.2.2 Voice of the customer	19
2.3 Gathering user requirements for displays	21
2.3.1 Focus Group of experts	21
2.3.2 Constructing a PST tree	22
2.3.3 Analysis of the PST tree for displays	23
2.4 EASI analysis	24
2.4.1 The EASI groups	24
2.4.2 The Quality Game	25
2.4.3 Analysis of EASI results	28

2.5	Results of the study	30
2.6	Conclusions	33
	References	33
	Appendix A: PST tree of requirements for desktop displays	34
	Appendix B: Results of EASI classification of secondaries	39
3	Application requirements and the evolution of displays	43
	<i>Philip Robertson</i>	
3.1	Introduction	43
3.2	The needs of advanced applications	45
3.2.1	Achieving interaction — performance requirements	46
3.2.2	Working context or ‘paradigm’ — generic architecture requirements	48
3.2.3	Display surface — GUI and geometry requirements	50
3.2.4	Overall implications of application requirements	51
3.3	Display support for perceptual colour addressing	52
3.3.1	Requirements for perceptual colour control	52
3.3.2	Perceptual colour gamut representations	53
3.3.3	Implications for display design — perceptual colour control	54
3.4	Perceptual sound control	55
3.5	Perceptual texture control	56
3.6	Summary and broader issues	58
	Acknowledgements	58
	References	59
4	Head-mounted display technology in virtual reality systems	61
	<i>Richard Holmes</i>	
4.1	Introduction	61
4.2	Overview of VR display requirements	63
4.3	Review of HMD options	64
4.3.1	Cathode ray tubes	64
4.3.2	Flat panel displays	65
4.3.3	Advanced alternative display technologies	66
4.4	Human factors of head-mounted displays	67
4.4.1	Photosensitive epilepsy	67
4.4.2	Accommodation and convergence disassociation	68
4.4.3	Motion sickness	68
4.4.4	Image quality	69
4.4.5	Colour	70
4.4.6	Brightness	70
4.4.7	Contrast	71
4.5	Technical issues in head-mounted displays	71
4.5.1	Backlights	71
4.5.2	Resolution	72
4.5.3	Transmittance	73

4.5.4	Pixel shape	74
4.5.5	Screen aspect ratio	74
4.5.6	Display size	75
4.5.7	Viewing angle	80
4.5.8	Screen refresh rate	80
4.5.9	Video format	80
4.5.10	Screen geometry	81
4.6	Conclusion	81
	References	82
5	Evaluating the spatial and textual style of displays	83
	<i>Ben Shneiderman, Richard Chimera, Ninad Jog, Ren Stimart and David White</i>	
5.1	Introduction	83
5.2	GUI design metrics	85
5.3	Dialogue evaluation methods	86
5.3.1	Dialogue box summary table	87
5.4	Testing our methods	92
5.5	Conclusions	93
	Acknowledgements	95

Preface

Display technology and (just as importantly) display systems have been subject to rapid development over the past few years. This development has been substantially enabled by the advances in performance and simultaneous reduction in the cost/performance ratio of computer systems. So rapid has been the rate of this development that users are increasingly expecting, and can increasingly afford, almost unlimited resolution and performance from display systems.

Such customer expectations create additional challenges for the display systems engineer and for the designer of any product that uses a display system. What performance is possible? What are the limits? What is permissible or not in terms of standards requirements and legislation? What are the trade-offs between cost, size, resolution, image quality, weight, power consumption, etc.? Which new display technologies are becoming available that might be more appropriate for the application?

For any display-based product to be successful, the needs of the application must be properly matched to the capabilities of the display system. This match can only be made in the context of the whole product design and development process. It must start with the analysis of market requirements, including an understanding of the tasks and needs of the users. It must figure in the prototyping and refining of the user interface and transaction dialogues. And it must be central to the integration of the display with the computer platform hardware and operating system software.

Seamless matching of the display to the application requires an understanding of system design from many perspectives, and brings to bear multidisciplinary skills in hardware, software, human factors, imaging, usability assessment and many other fields. The continuing development of display technology is just as much driven by the needs of new applications (in multimedia and virtual reality, for example) as the applications are shaped to exploit the capabilities of displays.

Recognizing these issues and realizing the need to create a forum where representatives of the wide range of disciplines encompassed by this subject could meet and interact, the European Region of the Society for Information Display (SID) organised an international two-day conference, 'Getting the Best from State-of-the-Art Display Systems', at the National Gallery, London, in February 1995. This event brought together a number of the leading experts from around the world and succeeded in placing the closer integration of display capabilities with application needs on the agenda for leading display system developers.

The objective of this volume is to extend the discussion to a wider audience. It contains a majority of the papers presented at the London conference, the authors of which are all
